Authorship of Final Report

[illegible]

Table of Contents

Figure List

Abstract

- summarizing the goal of the project and the design solution

Drop foot affects X people annually.

Executive summary

Design problem

- A summary of the information you have gathered concerning the design problem.
- References to sources of information (interviews, patents, books, articles, reports, information from web pages, competitor products, etc.)

- A discussion of the most important design constraints
- A description of alternative solutions to the problem that you have developed based on your creative thinking. These should include ideas that involve different concepts, rather than variations of a single principle. Include a decision matrix, a sketch or picture of each of your design ideas, and an explanation of how the device would operate. You must use a computer based software drawing package to produce professional looking drawings. Hand sketches are not acceptable.

- Preliminary evaluations of each of your design ideas, keeping in mind the requirements and specifications of the product. This should be more than just a listing of the advantages and disadvantages of each option. The evaluation should take into account the relative importance of the different evaluation criteria.

- The solution and a summary of your reasons for making the final design choices.

- A concise detailed presentation of your chosen design; this should include items such as dimensions, bill of materials, cost estimates, etc. Assembly and detail drawings (computer-generated as per Design Drawings instructions

below) should be included in the report but can be attached as an appendix. Also, if you have built a working prototype, you should include photographs.

- Description of regulatory issues associated with your design.
- Financial aspects relevant to your final design.
- A section describing the ethical issues surrounding your project.
- Suggestions for future modifications and improvements of your product (as appropriate).

- Properly cited references (use IEEE Transactions on Biomedical Engineering output style).

- A summary and conclusion section.
- An appendix.
- A separate section in the appendix that includes the final prototype performance specification.
- A separate section in the appendix that explains how to operate and use the device (in the form of a user guide)
